

Adding Users to SAMBA PASSWD Database

For users to access directories via the samba mechanism, they have to be added to the SAMBA passwd database. At present this is done manually. To add user USERNAME to the database an administrator would issue the command:

```
sudo smbpasswd -a USERNAME
```

where USERNAME is the username of the user. The application will prompt for a password. This password/username pair is prompted for when attempting to access the ISS directories via a windows computer. Note it appears that this process could be automated, but is currently not.
